**Advance Applied in Transplant Water to Improve Growth and Development of Tobacco, 2012**

In 2012, a demonstration plot was initiated to show the effects of ADVANCE on the early season growth and development of newly transplanted tobacco plants. The demonstration plot was set up near Nakina, North Carolina and 2 Qt/A of ADVANCE was used. Visual observation indicated that tobacco transplants treated with ADVANCE recovered quicker following transplanting and began to grow quicker and develop a better root system than untreated transplants. Advance is a plant growth enhancer containing a blend of highly-refined nutrients and natural carboxylic acids. Advance contains a clean 6-24-6 starter fertilizer with a micronutrient package. This ready to use product enhances solubilization and uptake of plant nutrients. ADVANCE is used in a variety of soil applications to aid early season plant development.

If fertilizer is already a part of the in-furrow program, ADVANCE can be applied at 8 oz/A to supplement the fertilizer to improve growth and development of roots.

ADVANCE is a product of Coastal AgroBusiness, 3702 Evans Street, Greenville NC 27834.
