Impact F Applied at Topdress to Improve Yields in Winter Wheat, 2013

On March 8th, 2013, Impact F was applied at 1 Qt/A with a topdress fertilizer application in winter wheat. This application was compared to a topdress fertilizer application without Impact F. The on-farm trial was conducted near Pinetown, North Carolina. The soil was a mineral soil with 2% organic matter.

Impact F is an active biological complex that acts as a plant stimulant because of the cell dividing properties of cytokinins. Resulting actions can produce a substantial increase in crop production and greatly enhance crop quality.

The application of Impact F improved the yield response by 12% and improved test weights by 3.6% when applied with the topdress fertilizer application compared to the topdress fertilizer applied alone (see Table 1).

| Treatment bu/A | Yield @ 13.5% | Test Weight |
|-----------------|---------------|-------------|
| Check | 57.008 | 55 |
| Impact F 1 Qt/A | 64.05 | 57 |

IMPACT F is a product of Coastal AgroBusiness. 3702 Evans Street Greenville, NC 27834.
